## New production line **B06**

Recuperator Spa announces the start up of a new production line for the model **B06** heat exchanger. The new line does not involve important changes in performances but rationalizes and simplifies the manufacture.

It is a modern equipment, in step with the current technological developments. Starting from the aluminium coil, the plates are prepared and assembled by an automatic, dedicated machine. The plates number in each model is managed by the computer, together with the number of pieces to be produced, with no man in the process.

Moreover, the new line advanced technology reduces the amount of materials scrap, with economical and environmental advantage. This results in a cost reduction that generates a significant effect on the sale price, as shown by the release A17.1 of the Rex.exe program, now available.

In most of the fin spacings, the new equipment repeats the plates geometry of the previous **B06** model that has been so successful in the 16 years of its presence on the market.

Only for the wider spacings a change has been introduced in the die, so that industrialized production is now easier.

With the construction of the new **B06** line, the production of the old **F06** model becomes unnecessary for the performance and no more convenient for the price.

Starting from 1/1/2013, therefore, the above mentioned **F06** model will be out of production.

Recuperator Spa continues to be committed to the heat recovery business with new products and advanced technology.

Best regards

C. Leone
